

Lucrul 11 - Sisteme de operare

→ read-write lock { → mutex } struct in loc de un lock pt read & write
 → comd
 → init
 → lock de read
 → lock de write

Stările unui proces (simplificat)

Semafor

- format - valoare v
- condi 2

- două operații: - P - wait, ~~return~~, lock, --

- V - post, elimină, unlock, ++

- P - (execuția de A)

$v(A) = v(A) - 1;$

if ($v(A) < 0$) {

stare(A) = WAIT

$q(A) \leftarrow A$

} da control la dispoziție

else {

} da controlul lui A

- V - (execuția de A)

$v(A) = v(A) + 1$

if ($v(A) < 0$) {

$q(A) \rightarrow B$

stare(B) = READY

da controlul la dispoziție

} else {

} da controlul lui A

→ bibliotecă de threaduri de utilizator (FIBRE)

get context

swap context

signal

vtalarm

(apelați sistem)

planifică semnal periodic
